

Python Programming

Home Practice Worksheet

Name: _____

Class: _____ Date: _____

Score: _____ / 50

Section A – Multiple Choice Questions (1 mark each × 10 = 10 marks)

1. Who created the Python programming language?
 - a) James Gosling
 - b) Guido van Rossum
 - c) Dennis Ritchie
 - d) Linus Torvalds

2. Which of the following is a valid Python variable name?
 - a) 2name
 - b) `_my_var`
 - c) `my-var`
 - d) `class`

3. What is the output of: `print(type(3.14))`
 - a) `<class 'int'>`
 - b) `<class 'float'>`
 - c) `<class 'str'>`
 - d) `<class 'number'>`

4. Which operator is used to check if two values are equal in Python?
 - a) `=`
 - b) `!=`
 - c) `==`
 - d) `=>`

5. What type of data is `"Hello, World!"` in Python?
 - a) `int`
 - b) `float`
 - c) `bool`
 - d) `str`

6. Which keyword is used to start a conditional statement in Python?
 - a) `when`
 - b) `if`
 - c) `check`
 - d) `case`

7. What is the result of: `10 % 3`
 - a) 3
 - b) 1
 - c) 0
 - d) 10

8. Which of the following is a Python keyword?
- a) print
 - b) hello
 - c) True
 - d) number
9. What does // do in Python?
- a) Floating point division
 - b) Remainder division
 - c) Floor (integer) division
 - d) Exponent
10. Which of these is NOT a valid data type in Python?
- a) int
 - b) decimal
 - c) bool
 - d) str

Section B – Fill in the Blanks (1 mark each × 8 = 8 marks)

11. Python was created by _____ in the year _____.
12. A _____ stores a value that can change during program execution.
13. The data type used to store True or False values is called _____.
14. The _____ operator is used to raise a number to a power (e.g., $2^{**}3 = 8$).
15. In Python, a block of code inside an if statement must be _____ (shifted right).
16. The keyword _____ is used to handle the false condition in an if statement.
17. The _____ function is used to display output on the screen.
18. Coding is _____ (broader/narrower) than Programming.

Section C – Short Answer Questions (2 marks each × 6 = 12 marks)

19. What is the difference between Programming and Coding? Give one example each.

Answer:

Answer: _____

Answer: _____

20. List any four Python keywords and write one sentence explaining why they cannot be used as variable names.

Keywords:

Reason:

Answer: _____

21. What are the six main data types in Python? Give one example value for each.

Data Type	Example Value	What it stores

22. Write the rules for naming a variable in Python. (List at least 3 rules.)

1.

2.

3.

23. Explain the difference between `=` and `==` in Python with an example.

`=` means:

`==` means:

Example: _____

24. What happens if we forget to indent the code inside an if statement? What error does Python show?

Answer:

Answer: _____

Section D – Programming Questions (5 marks each × 4 = 20 marks)

Q25 – Predict the Output (1 mark each × 5 = 5 marks)

Write what the following programs will print:

a) Predict the output:

```
x = 10
```

```
y = 3
```

```
print(x + y)
```

```
print(x * y)
print(x % y)
```

Output:

b) Predict the output:

```
name = "Priya"
age = 12
print("Hello, " + name)
print("You are", age, "years old")
```

Output:

c) Predict the output:

```
marks = 75
if marks >= 50:
    print("Pass")
else:
    print("Fail")
```

Output:

Q26 – Find the Error and Fix It (5 marks)

The programs below have mistakes. Find the errors, explain them, and write the correct version:

a) Find and fix the error:

```
2score = 95
print(2score)
```

Error:

Fixed code:

b) Find and fix the error:

```
temperature = 38
if temperature > 37
    print("You have a fever")
```

Error:

Fixed code:

c) Find and fix the error:

```
x = 5
if x == 5:
    print("Five!")
```

Error:

Fixed code:

Q27 – Write the Program (5 marks)

Write a Python program that:

- Stores your name, age, and favourite subject in variables
- Prints all three values with a nice message
- Checks if your age is greater than 10 and prints "Senior Student" or "Junior Student"

```
# Write your program below:
```

Q28 – Challenge Problem (5 marks ☆ Bonus)

Write a Python program that takes a number and:

- Checks if the number is positive, negative, or zero
- Prints an appropriate message for each case
- Also prints whether the number is even or odd (hint: use %)

```
# Write your program below:
```
